JAVA PROJECT REPORT ON

STUDENT INTERNSHIP APPLICATION AND STATUS TRACKING SYSTEM

Submitted by

MS.DHARSHINI A

25BSC109

Under the Guidance of

MR.ARAVIND

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026

Semester: **II**

DECLARATION

I hereby declare that the project entitled **"Student Internship Application and Status Tracking System"** submitted in partial fulfillment of the requirements for the course [**Java Programming]** is a **record of my original work** carried out under the guidance of **[Mr. Aravind]**, Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

DHARSHINI A

CERTIFICATE

This is to certify that the project entitled **"Student Internship Application and Status Tracking System"** is a **bona fide work** carried out by **[DHARSHINI A] [CS-1B-2025]**, [**Computer Science]**, **KG College of Arts & Science**, in partial fulfillment of the requirements for the course **[Java Programming]**.

This project has been completed under my supervision and guidance during the academic period **April 2026**.

Place: Coimbatore

Date: 10.04.2026

Submitted for the Viva-Voce Examination held on 10.04.2026

ABSTRACT

The Student Internship Application and Status Tracking System is developed to simplify and automate the internship application process. In the existing system, students apply for internships manually, which leads to delays and lack of transparency. This project provides a centralized system where students can register, view available internships, and apply for them easily.

The system allows companies or administrators to view student applications and update their selection status. Students can track the status of their applications in real time, improving communication and reducing confusion. The system is implemented using java programming and follows a structured approach for handling data and user interactions.

Overall, this project improves efficiency, reduces manual work, and provides a clear and organized way to manage internship applications and status tracking.

1. INTRODUCTION

The Student Internship Application and Status Tracking System is designed to simplify the process of applying for internships. In the traditional method, students apply manually, which often leads to delays, lack of transparency, and difficulty in managing applications.

This system provides a centralized platform where students can easily register, view available internships, and apply online. Companies or administrators can review applications and update the selection status. This helps in improving efficiency and communication between students and recruiters.

1.1 Objective

- To develop a system for managing internship applications in a centralized way
- To allow students to view and apply for internships easily
- To enable companies to manage and update application status
- To reduce manual work and improve efficiency
- To provide transparency through status tracking

1.2 Overview

The system is a Java-based application that allows students, companies, and administrators to interact through a structured process. Students can enter their details and apply for internships, while companies can review applications and update their status.

The system stores and processes data efficiently and displays the results clearly. It ensures smooth communication and tracking of internship applications from submission to final status.

1.3 Features

- Student registration and application submission
- Viewing available internships
- Easy application process
- Application status tracking
- Company/admin can review applications
- Status update functionality
- Centralized data management

1. PROGRAM ANALYSIS

The Student Internship Application and Status Tracking System is developed using Java programming. The program is designed to manage internship applications in a structured way. It uses classes like Student and internship to store and organize data.

The system has two main modules: student module and company/admin module. The student module allows users to enter details, view internships, and apply. The admin module allows viewing all applications and updating their status.

The program uses ArrayList for storing data and control statements like loops and conditions to manage system flow. It ensures proper input, processing, and output display, making the system simple and efficient.

2.1 Problem Definition

In the existing system, internship applications are handled manually, which leads to delays and lack of proper tracking. Students do not get timely updates about their application status, and companies face difficulty in managing multiple applications.

This project aims to solve these problems by providing a system where students can apply for internships and track their status, while companies can easily manage and update applications.

2.2 Project Overview

The Student Internship Application and Status Tracking System provides a centralized platform for managing internship applications. Students can register, view available internships, and apply for them. Companies or administrators can review applications and update their status.

2.3 Scopes and Limitations

Scope:

The scope of the project includes:

- Managing student internship applications
- Providing status tracking
- Allowing companies to review and update applications
- Displaying application details clearly

Limitations:

- The system is console-based with no graphical user interface
- Data is stored temporarily using ArrayList (no database)
- Limited scalability for large number of users
- No advanced features like notifications or resume upload
- Basic security (no authentication system)

1. SYSTEM DESIGN

The Student Internship Application and Status Tracking System is designed using a simple and structured approach. The system follows a modular design where different functionalities are divided into separate parts for better management.

The system mainly consists of user interaction, data processing, and data storage. The user interacts with the system through a console interface by entering details and selecting options. The system processes the input using Java logic and stores the data using data structures like ArrayList.

The workflow of the system starts with the user selecting an option (student or admin). Students can apply for internships, and their data is stored in the system. The admin can view all applications and update their status. The updated information is then displayed to the user. This design ensures simplicity, easy understanding, and efficient functioning of the system.

3.1 Modules

The system is divided into the following main modules:

1. Student Module:
   This module allows students to:
   - Enter personal details (name, email, skills)
   - View available internships
   - Apply for internships
   - Track application status
2. Internship Module:
   This module manages internship details:
   - Stores internship ID, title, and company name
   - Displays available internships to students
3. Application Management Module:
   This module handles:
   - Storing student applications
   - Managing application data using ArrayList
   - Displaying application details
4. Admin / Company Module:
   This module allows admin or company to:
   - View all student applications
   - Update application status (Selected / Rejected / Under Review)
5. Status Tracking Module:
   This module is responsible for:
   - Showing the current status of applications
   - Updating and displaying status changes

2. METHODOLOGY

The methodology of this project follows a step-by-step approach. First, the problem in the existing manual internship system was identified. Then, the system was designed by dividing it into modules such as student and admin modules.

After designing, the system was implemented using Java programming language. Data structures like ArrayList were used to store application details. The program was tested with different inputs to ensure correct working.

Finally, the output was verified to check whether the system meets the project objectives.

4.1. Problem Analysis

In the existing system, internship applications are handled manually, which leads to delays and lack of proper tracking. Students do not receive timely updates about their application status, and companies find it difficult to manage multiple applications.

There is no centralized system to store and manage data efficiently. This results in confusion, inefficiency, and lack of transparency in the internship process.

4.2. System Design

The system is designed in a simple way by dividing it into different modules. Each module performs a specific task, which makes the system easy to understand and manage.

The system starts with the user selecting an option. If the user is a student, they can enter their details, view available internships, and apply. The application data is stored in the system. If the user is an admin, they can view all applications and update the status. The updated status is then shown to the user.

The system is divided into the following main modules:

- Student Module: Allows students to enter details and apply for internships.
- Internship Module: Stores and displays available internship details.
- Application Module: Manages and stores student application data.
- Admin Module: Allows admin to view applications and update status.

4.3. Program Development

The program was developed using Java programming language. The system was designed using classes such as Student and Internship to manage data. Different modules like student and admin were implemented step by step. Control statements like loops and conditions were used to handle user input and system flow. ArrayList was used to store and manage application data efficiently.

4.4. Testing and Validation

The program was tested with different inputs to ensure correct working. Various test cases were used, such as entering valid and invalid data, applying for internships, and updating application status. The system was **v**alidated by checking whether the output matches the expected results. All functionalities were tested to ensure **t**he program runs without errors.

4.5. Result and Documentation

The system successfully performs all required functions such as student registration, internship application, and status tracking. The output is displayed clearly and matches the expected results. The program is efficient and easy to use for small-scale applications.

The documentation includes details about system design, modules, algorithm, and outputs. It explains how the system works and helps users understand and use the application effectively.

4.6. Algorithm

1. Start the program

2. Display main menu (Student / Admin / Exit)

3. Read user choice

4. If user selects Student:

- Enter name, email, and skills
- Display available internships
- Enter internship ID
- Store student details in list
- Display “Application Submitted” with status

5.Else if user selects Admin:

- Display options (View / Update)
- If View → Display all applications
- If Update → Enter email and update sstatus

6.Else if user selects Exit:

- Stop the program

7.Repeat steps until user exits

8. End

7. DISCUSSION & CONCLUSION

7.1 Discussion

The Student Internship Application and Status Tracking System is developed to make the internship process easier and more organized. In the traditional method, students face difficulties in applying for internships and checking their application status. The process is usually manual and takes more time.

This system allows students to apply for internships online and upload required documents. It also helps administrators to review applications and update the status easily. Students can check whether their application is approved, rejected, or under review at any time.

The system improves communication between students, coordinators, and companies. It reduces paperwork, saves time, and avoids confusion. Overall, it makes the internship process faster, clearer, and more efficient.

7.2 Conclusion

The Student Internship Application and Status Tracking System is a useful and efficient web-based system. It replaces the manual process with an automated system that is easy to use.

The system helps students apply for internships easily and track their status in real time. It also helps administrators manage applications in a better way. This system reduces errors, saves time, and improves the overall internship management process.

In conclusion, the system is an effective solution for improving internship management in educational institutions.
